## MSML640: Computer Vision Assignment 1

## **Instructions**

- 1. Answer sheets, code and input/output images must be submitted on Canvas.
- Save your answer sheet containing the written answers in a file named:
   FirstName\_LastName\_ASN1.pdf. Please submit your code, input/output images and answer sheets
   in a zip file named: FirstName\_LastName\_ASN1\_py.zip. Please do not create subdirectories within
   the main directory.
- 3. For the implementation questions, make sure your code is bug-free and works out of the box. Please be sure to submit all main and helper functions. Be sure to not include absolute paths. Points will be deducted if your code does not run out of the box.
- 4. If plots are required, you must include them in your answer sheet (pdf) and your code must display them when run. Points will be deducted for not following this protocol.

## 1 Short answer problems [60 points]

- 1. Read through the provided Python NumPy and Matplotlib introduction code and comments provided. Open an interactive session in Python and test the commands by typing them at the prompt.
- 2. Describe (in words) the result of each of the following Python commands. Search the NumPy API documentation http://docs.scipy.org/doc/numpy/ if needed, but try to determine the output without

entering the commands into Python. Do not submit a screenshot of the result of typing these commands. [16 points]

- 3. Write a few lines of code to do each of the following. Copy and paste your code into the answer sheet. [14 points]
  - (a) Use numpy.random.rand to return the roll of a six-sided die over N trials.
  - (b) Let y be the vector: y = np.array([1, 2, 3, 4, 5, 6]). Use the reshape command to form a new matrix z that looks like this: [[1,2],[3,4],[5,6]]
  - (c) Use the numpy.max and numpy.where functions to set x to the maximum value that occurs in z (above), and set r to the row number (0-indexed) it occurs in and C to the column number (0-indexed) it occurs in.
  - (d) Let v be the vector: v = np.array([1, 8, 8, 2, 1, 3, 9, 8]). Set a new variable x to be the number of 1's in the vector v.
- 4. Create any 100 x 100 matrix A (not all constant). Save A in a .npy file called inputAPSOQ1.npy and submit it. Write a script which loads inputAPSOQ1.npy and performs each of the following actions on A. Name it PSOQ1.py and submit it. [30 points]
  - (a) Plot all the intensities in A, sorted in decreasing value. Provide the plot in your answer sheet. (Note, in this case we don't care about the 2D structure of A, we only want to sort the list of all intensities.)
  - (b) Display a histogram of A's intensities with 20 bins. Again, we do not care about the 2D structure. Provide the histogram in your answer sheet.
  - (c) Create a new matrix X that consists of the bottom left quadrant of A. Display X as an image in your answer sheet using matplotlib.pyplot.imshow with no interpolation (blurry effect). Look at the documentation for matplotlib.pyplot.imshow. Save Xin a file called output XPSOQ1.npy and submit the file.
  - (d) Create a new matrix Y, which is the same as A, but with A's mean intensity value subtracted from each pixel. Display Y as an image in your answer sheet using matplotlib.pyplot.imshow. Save Y in a file called outputyPSOQ1.npy and submit the file.
  - (e) Create a new matrix Z that represents a color image the same size as A, but with 3 channels to represent R, G and B values. Set the values to be red (i.e., R = 1, G = 0, B = 0) wherever the intensity in A is greater than a threshold t = the average intensity in A, and black everywhere else. Display Z as an image in your answer sheet using matplotlib.pyplot.imshow. Save Z as outputZPSOQ1.png and submit the file. Be sure to view outputZPSOQ1.png in an image viewer to make sure it looks right.

## 2 Short programming example [40 points]

Choose any color image from the web or your personal collection and name it inputPSOQ2.jpg. Write a script which performs the following transformations and displays the results in a figure using the Python subplot(matplotlib.pyplot.subplots) function in a 3x2 grid (3 rows and 2 columns). Each subplot should contain the output of each of the below operations. Label each subplot with an appropriate title. Provide the subplot in your answer sheet. Avoid using loops. Name the script PSOQ2.m(py). Note: The transformed images should be in png format.

- 1. Load the input color image and swap its red and green color channels. Save the output as SwapImgPSOQ2.png.
- 2. Convert the input color image to a grayscale image. Save the output as grayImgPSOQ2.png.
- 3. Perform each of the below transformations on the grayscale image produced in part 2 above.
  - (a) Convert the grayscale image to its negative image, in which the lightest values appear dark and vice versa. Save the output as negativeImgPS0Q2.png.
  - (b) Map the grayscale image to its mirror image, i.e., flipping it left to right. Save the output as mirrorImgPSOQ2.png.
  - (c) Average the grayscale image with its mirror image (use typecasting). Save the output as avgImgPSOQ2.png.
  - (d) Create a matrix N whose size is same as the grayscale image, containing random numbers in the range [0 255]. Save this matrix in a file called noise.mat(npy). Add N to the grayscale image, then clip the resulting image to have a maximum value of 255. Save the output as addNoiseImgPSOQ2.png.

Be sure to submit the input image, all the output images and noise.mat(npy).

*Python Tips:* Do the necessary typecasting (uint8 and double) when working with or displaying the images. If you can't find some functions in numpy (such as rgb2gray), you can write your own function. For example:

```
def rgb2gray(rgb):
return np.dot(rgb[...,:3], [0.2989, 0.5870, 0.1140])¹
```
